labeling connected objects

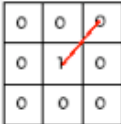

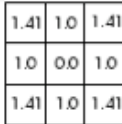

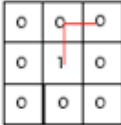

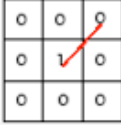

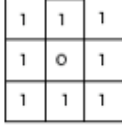

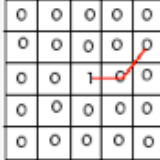

labeling connected objects

labeling connected objects

distance transforms

Distance Metric	Description	Illustration
Euclidean	The Euclidean distance is the straight-line distance between two pixels.	 Image  Distance transform
City Block	The city block distance metric measures the path between the pixels based on a 4-connected neighborhood. Pixels whose edges touch are 1 unit apart; pixels diagonally touching are 2 units apart.	 Image  Distance transform
Chessboard	The chessboard distance metric measures the path between the pixels based on an 8-connected neighborhood. Pixels whose edges or corners touch are 1 unit apart.	 Image  Distance transform
Quasi-Euclidean	The quasi-Euclidean metric measures the total Euclidean distance along a set of horizontal, vertical, and diagonal line segments.	 Image  Distance transform

template registration

the correspondence problem

precise, but accurate?

the correspondence problem

precise, but accurate?

Avants, et al. 2008

registration application 1: deformation-based morphometry

template
(vs. individual)
Jacobian

individual
(vs. template)
Jacobian

Avants, et al. 2008

Jacobian matrix: representation of a differential, an $n \times n$ matrix of first order partial derivatives whose entry in the i -th row and j -th column is $\partial f_i / \partial x_j$. The Jacobian can be thought of as describing the amount of "stretching" that a transformation imposes.

registration application 2: anatomical localization

registration application 3: group analysis of data

data (structure, function, physiology, landmarks) in individual space

individuals normalized to template space

registration application 3: group analysis of data

data (structure, function, physiology, landmarks) in individual space

individuals normalized to template space

registration application 3:

MNI Atlas, van Essen surface-based atlas, LONI deformable atlas, Zilles' probability map, (clockwise from upper left)

registration applications

What characterizes a registration algorithm?

Similarity metric: SSD, MSD, (n)CR, (n)CC, MI,...

Transformation: affine, piecewise linear, nonlinear,...

Regularization: multi-resolution/scale, Gaussian blur,...

Optimization: simplex, gradient descent,...

Interpolation: nearest-neighbor, trilinear, cubic, sinc,...

Algorithms

Software	Similarity metric	Transformation	DOF
FLIRT (linear)	nCR	linear, rigid-body	9, 6
AIR	MSD	5th-order polynomial warps	168
ANIMAL	CC	local translations	69,000
ART	nCC	FFD based on cubic splines (H, np)	7,000,000
Diffeomorphic Demons	SSD	displacement field (D, np)	21,000,000
FNIRT	SSD	cubic B-splines	30,000
IRTK	nMI	cubic B-splines	1,400,000
JRD-fluid	Jensen-Rényi divergence	viscous fluid; variational calculus (D)	2,000,000
ROMEO	displaced frame difference	local affine	2,000,000
SICLE	SSD	3-D Fourier series (D)	8,000
SyN	CC	bi-directional diffeomorphism (D)	28,000,000
SPM5	SPM2-type	discrete cosine transforms	1,000
	Normalize	discrete cosine transforms	1,000
	Unified Segment	discrete cosine transforms	1,000
	DARTEL toolbox	FDM of viscosity field (Dc)	6,400,000

n = normalized
 CC = cross-correlation
 CR = correlation ratio
 MI = mutual information
 MSD = mean of squared differences
 SSD = sum of squared differences

D = diffeomorphic
 Dc = diffeomorphic, constant over time
 FDM = finite difference model
 FFD = free-form deformation
 H = homeomorphic
 np = nonparametric

Algorithms

Software	Regularization	Multi-resolution
FLIRT (linear)		
AIR	increase of polynomial order	sparse to fine voxel sampling
ANIMAL	stiffness parameter at each node	local Gaussian
ART		median- & low-pass Gaussian
Diffeomorphic Demons		Gaussian
FNIRT	membrane energy	down- to up-sampling; # basis components
IRTK	none used in study	control mesh
JRD-fluid	compressible viscous fluid	multi-resolution
ROMEIO	explicit method; brightness constancy	adaptive multigrid (octree); Gaussian
SICLE	linear elasticity; inverse consistency	# basis components
SyN	transformation symmetry	xfm symmetry; Gaussian of velocity field
SPM5	SPM2-type	
	Normalize	
	Unified Segment	
DARTEL toolbox	linear elasticity	full multigrid (recursive)

Nonlinear registration example

local translations, free-form deformations

optimization of 3 translational parameters
to maximize the neighborhood cross-
correlation for each node (ANIMAL)

Nonlinear registration example

topological constraints: diffeomorphisms

homeomorphism: continuous mapping and inverse, but not deformation (trefoil knot, circle)

diffeomorphism: bijective map from manifold M to N and its inverse are differentiable

FIG. 4. Accurate localization of this large World Health Organization Grade III astrocytoma was not possible due to distortion and shifting of the frontoparietal gyri. *Left:* Sagittal MR image. The sulci are effaced and landmarks are not identifiable on sectional images. *Right:* A BSR image clearly demonstrating localization of the tumor in the parietal lobe and extension of the lesion as it infiltrates the postcentral gyrus. By depicting the entire extent of the tumor along the brain surface, infiltration of the precentral gyrus could be ruled out.
